

Municipal screening construct

Analytical roles, transformations and outputs used to estimate the 2024 potential-accessibility gap.

Analytical role	Observed source	Transformation	Output	Interpretation
Need signal	SIVIGILA attempted-suicide notifications; DANE IPM	Within-year standardisation and component averaging	$Need_{it}$	Severe surveillance and social vulnerability signal
Service opportunity	REPS-enabled sites; DANE population; centroid matrix	Hansen and E2SFCA accessibility metrics	$Access_{it}$	Potential accessibility, not realised care
Territorial mismatch	Need and accessibility on the municipal scale	Standardised difference: $Need_{it} - Access_{it}$	Gap_{it}	Maps, ranked excerpts and Moran's I

Claim boundary Ecological municipal screening; broad REPS supply measure; centroid travel-time approximation; OSRM routing and provider geocoding remain pending.
